PORTFOLIO EXPANSION PLAN & FUTURE FEATURES — PHASE II

Project Overview

To build on top of your premium retro-minimalist developer portfolio, Phase II focuses on adding interactive client-side widgets, real-time API integrations, advanced customization mechanics, and personalized analytics. Below is a structured blueprint of features recommended for your next sprint.

Recommended Features

1. Dynamic Dark/Light Mode Selector
Add an interactive terminal-style toggler (e.g., custom theme command options like 'theme: retro-dark', 'theme: paper-light', 'theme: neon') in the command palette and floating sidebar to dynamically switch stylesheets.
2. Interactive Project Case Studies
Expand project cards to open premium detailed modals or dedicated sub-pages that house case study stories, system design architectural flowcharts (Mermaid), and live deployment stats.
3. Local Weather/Location Widget
Use your geolocation to show a personalized, real-time widget matching your timezone in the footer (e.g., 'Currently 24C & Sunny in Dehradun').
4. Interactive Dev Playground
Add a minimal, client-side live code sandboxed terminal or markdown playground directly on the portfolio where recruiters can play with minor Javascript/Python scripts or view execution output.

5. Visitors Guestbook (Database Integrations)

Sync a Supabase or Firebase database to render a premium guestbook where visitors can leave custom micro-messages, custom feedback, or signatures.

6. Email Notification Automations

Hook up EmailJS, Resend, or SendGrid APIs to dispatch direct notification emails to your inbox automatically when someone completes the contact form on your portfolio.
